

Exercise: Book Library Index

1. Create an Index with Mapping

Create an index called `library` with the following mapping:

- `title` → `text` field with a custom analyzer (`standard` tokenizer, `lowercase` filter).
 - `author` → `keyword` field.
 - `published_year` → `integer`.
 - `description` → `text` with `english` analyzer.
-

2. Insert Documents

Insert at least **3 documents** using `POST /library/_doc/`:

1. Book: *The Alchemist* by Paulo Coelho, 1988, "A philosophical story about following dreams."
 2. Book: *Sapiens* by Yuval Noah Harari, 2011, "A brief history of humankind."
 3. Book: *1984* by George Orwell, 1949, "A dystopian novel about totalitarianism."
-

3. Test Versioning

- Update the description of *The Alchemist* to: "A story of Santiago, a shepherd, searching for treasure."
 - Use **version control** (`?if_seq_no` and `?if_primary_term`) to avoid accidental overwrites.
-

4. Run Simple Queries

- Get all books by `George Orwell`.
 - Search books containing the word "history" in their description.
 - Search books published **after 2000**.
-

Bonus Challenge

- Add another document with `_id = 1`. Check how ES handles overwriting vs updating the same `_id`.
- Try analyzing the word "dreams" using the `english` analyzer.
